

Podi's unique semiochemical compound is currently under development and will be available in various forms

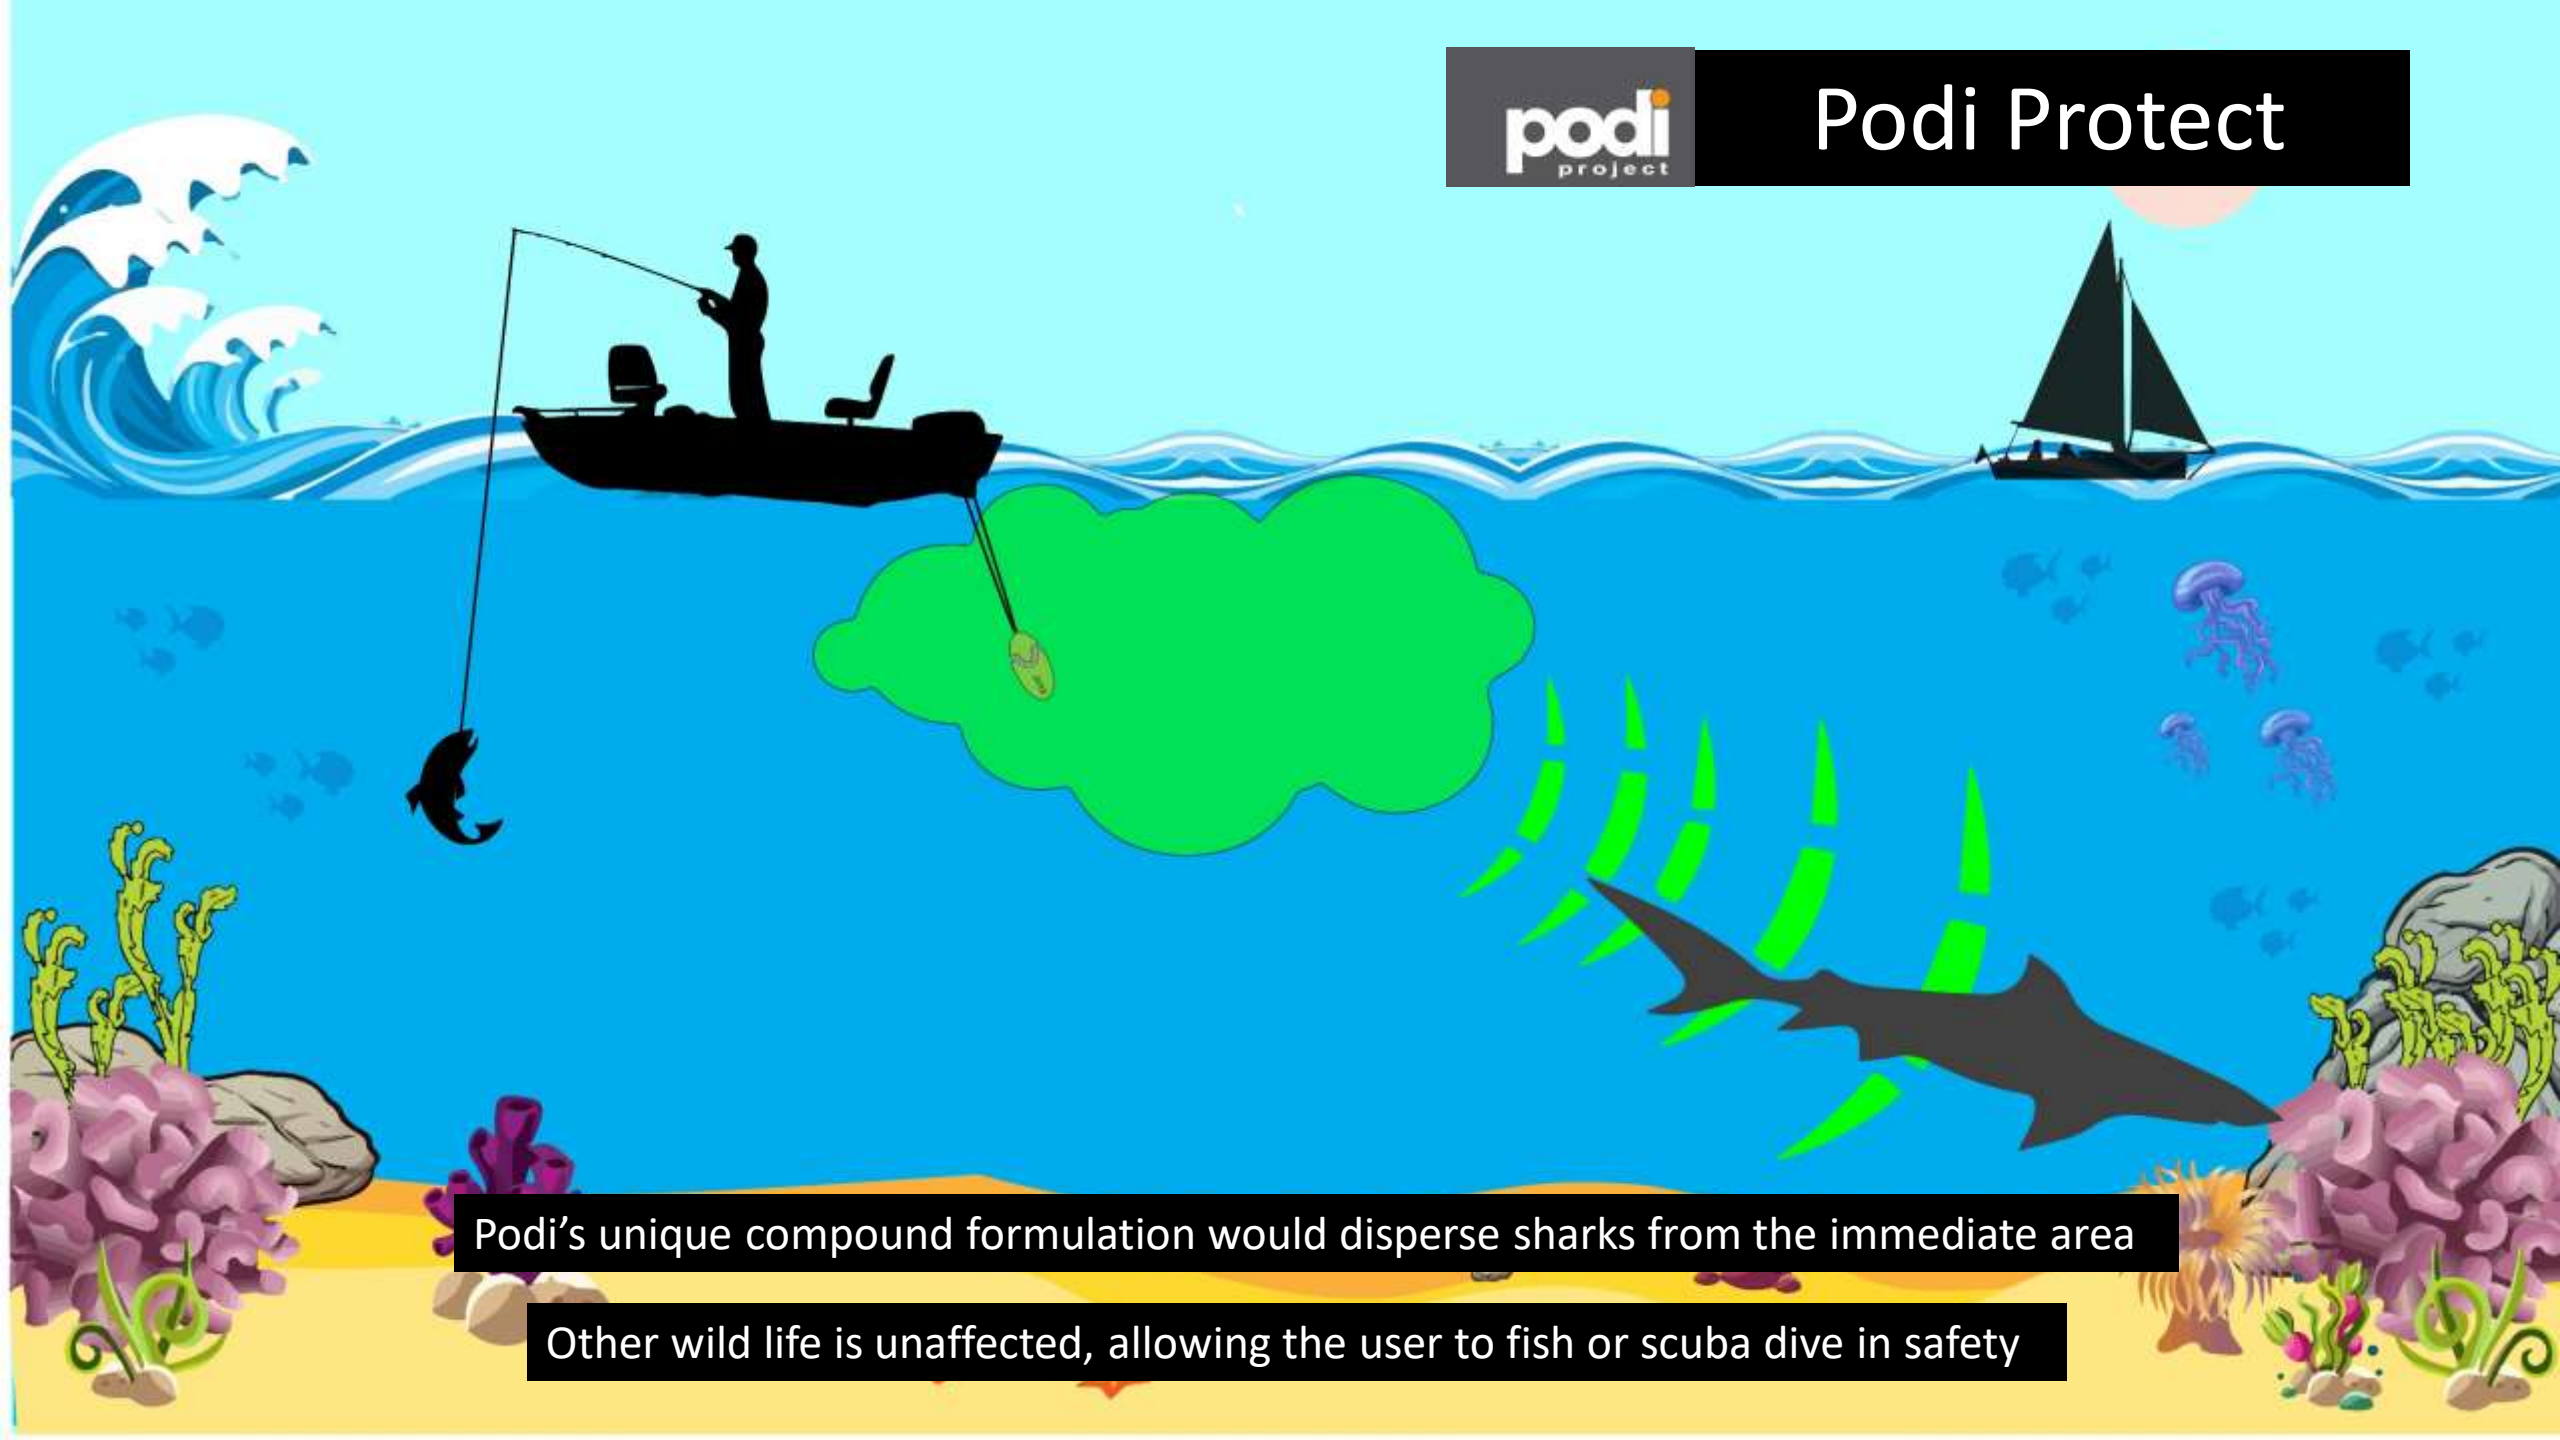

Many years of research and field trials have indicated that the concept is proven sufficiently to progress to the next stage, which is the full development of the product

Podi would contain a slow-release solvent tablet

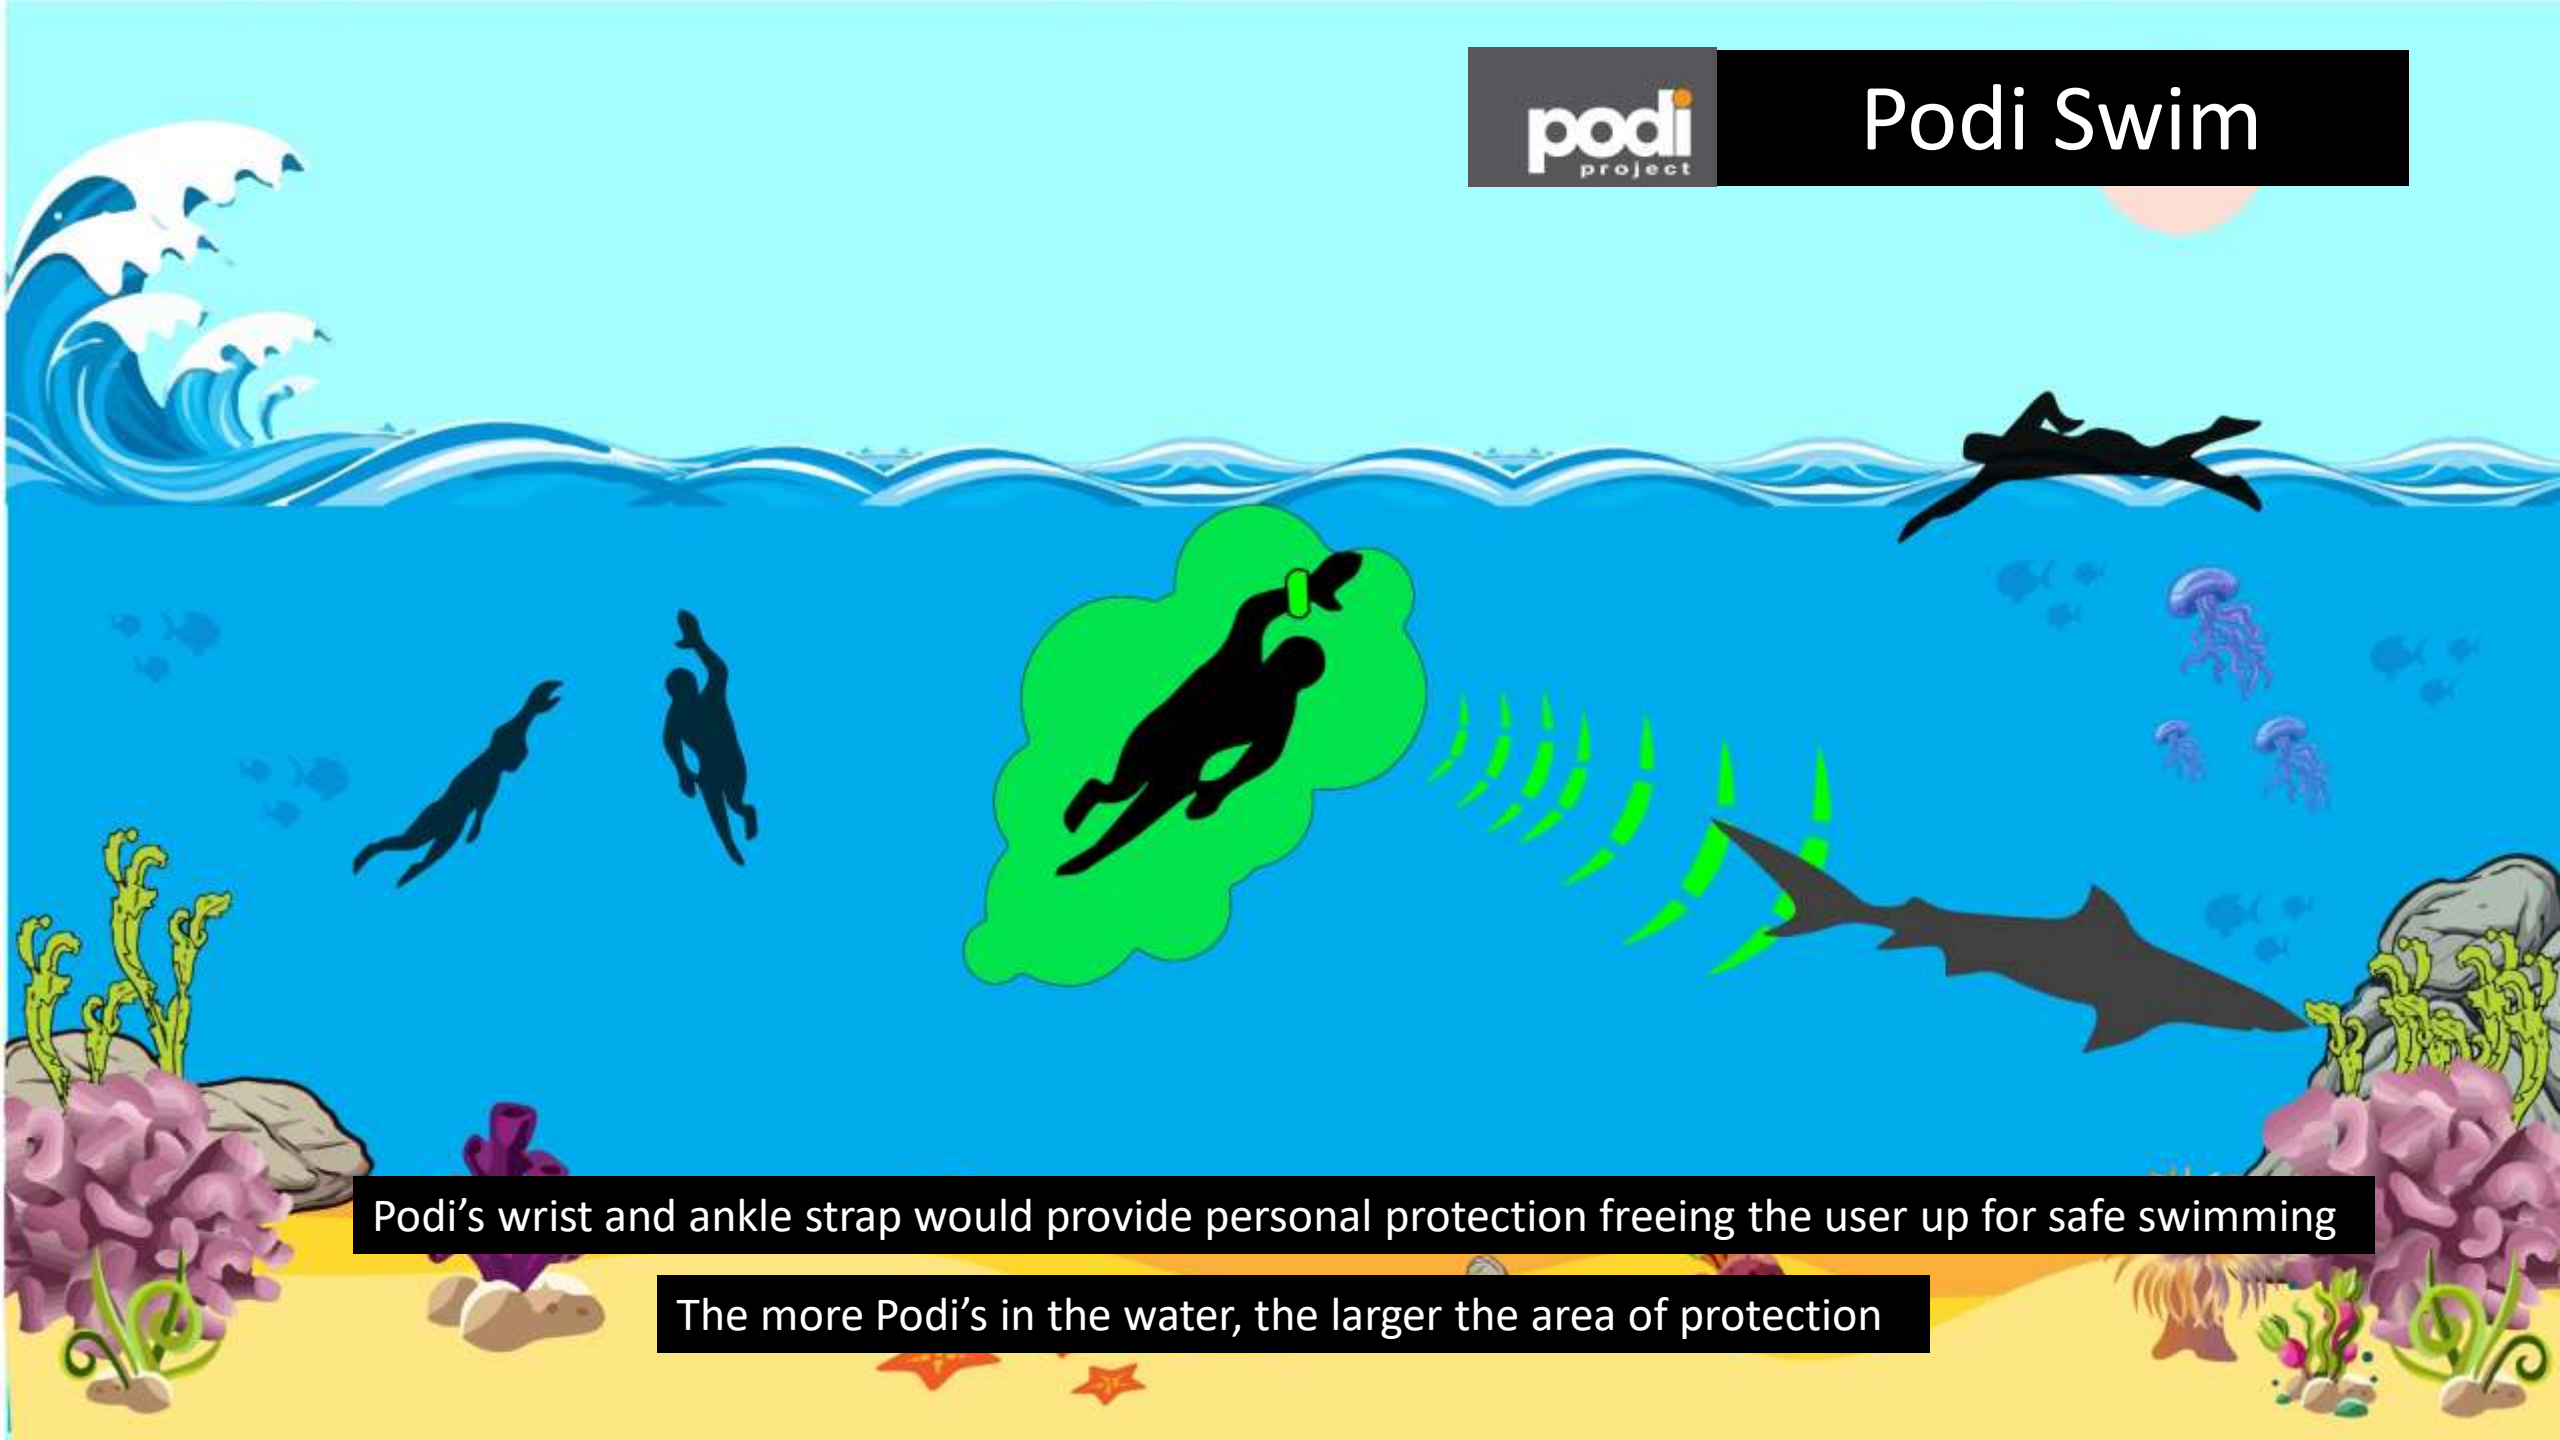

By removing the need to activate, Podi would create a continuous safety zone

This would allow Podi to be used across a wide variety of sports activities

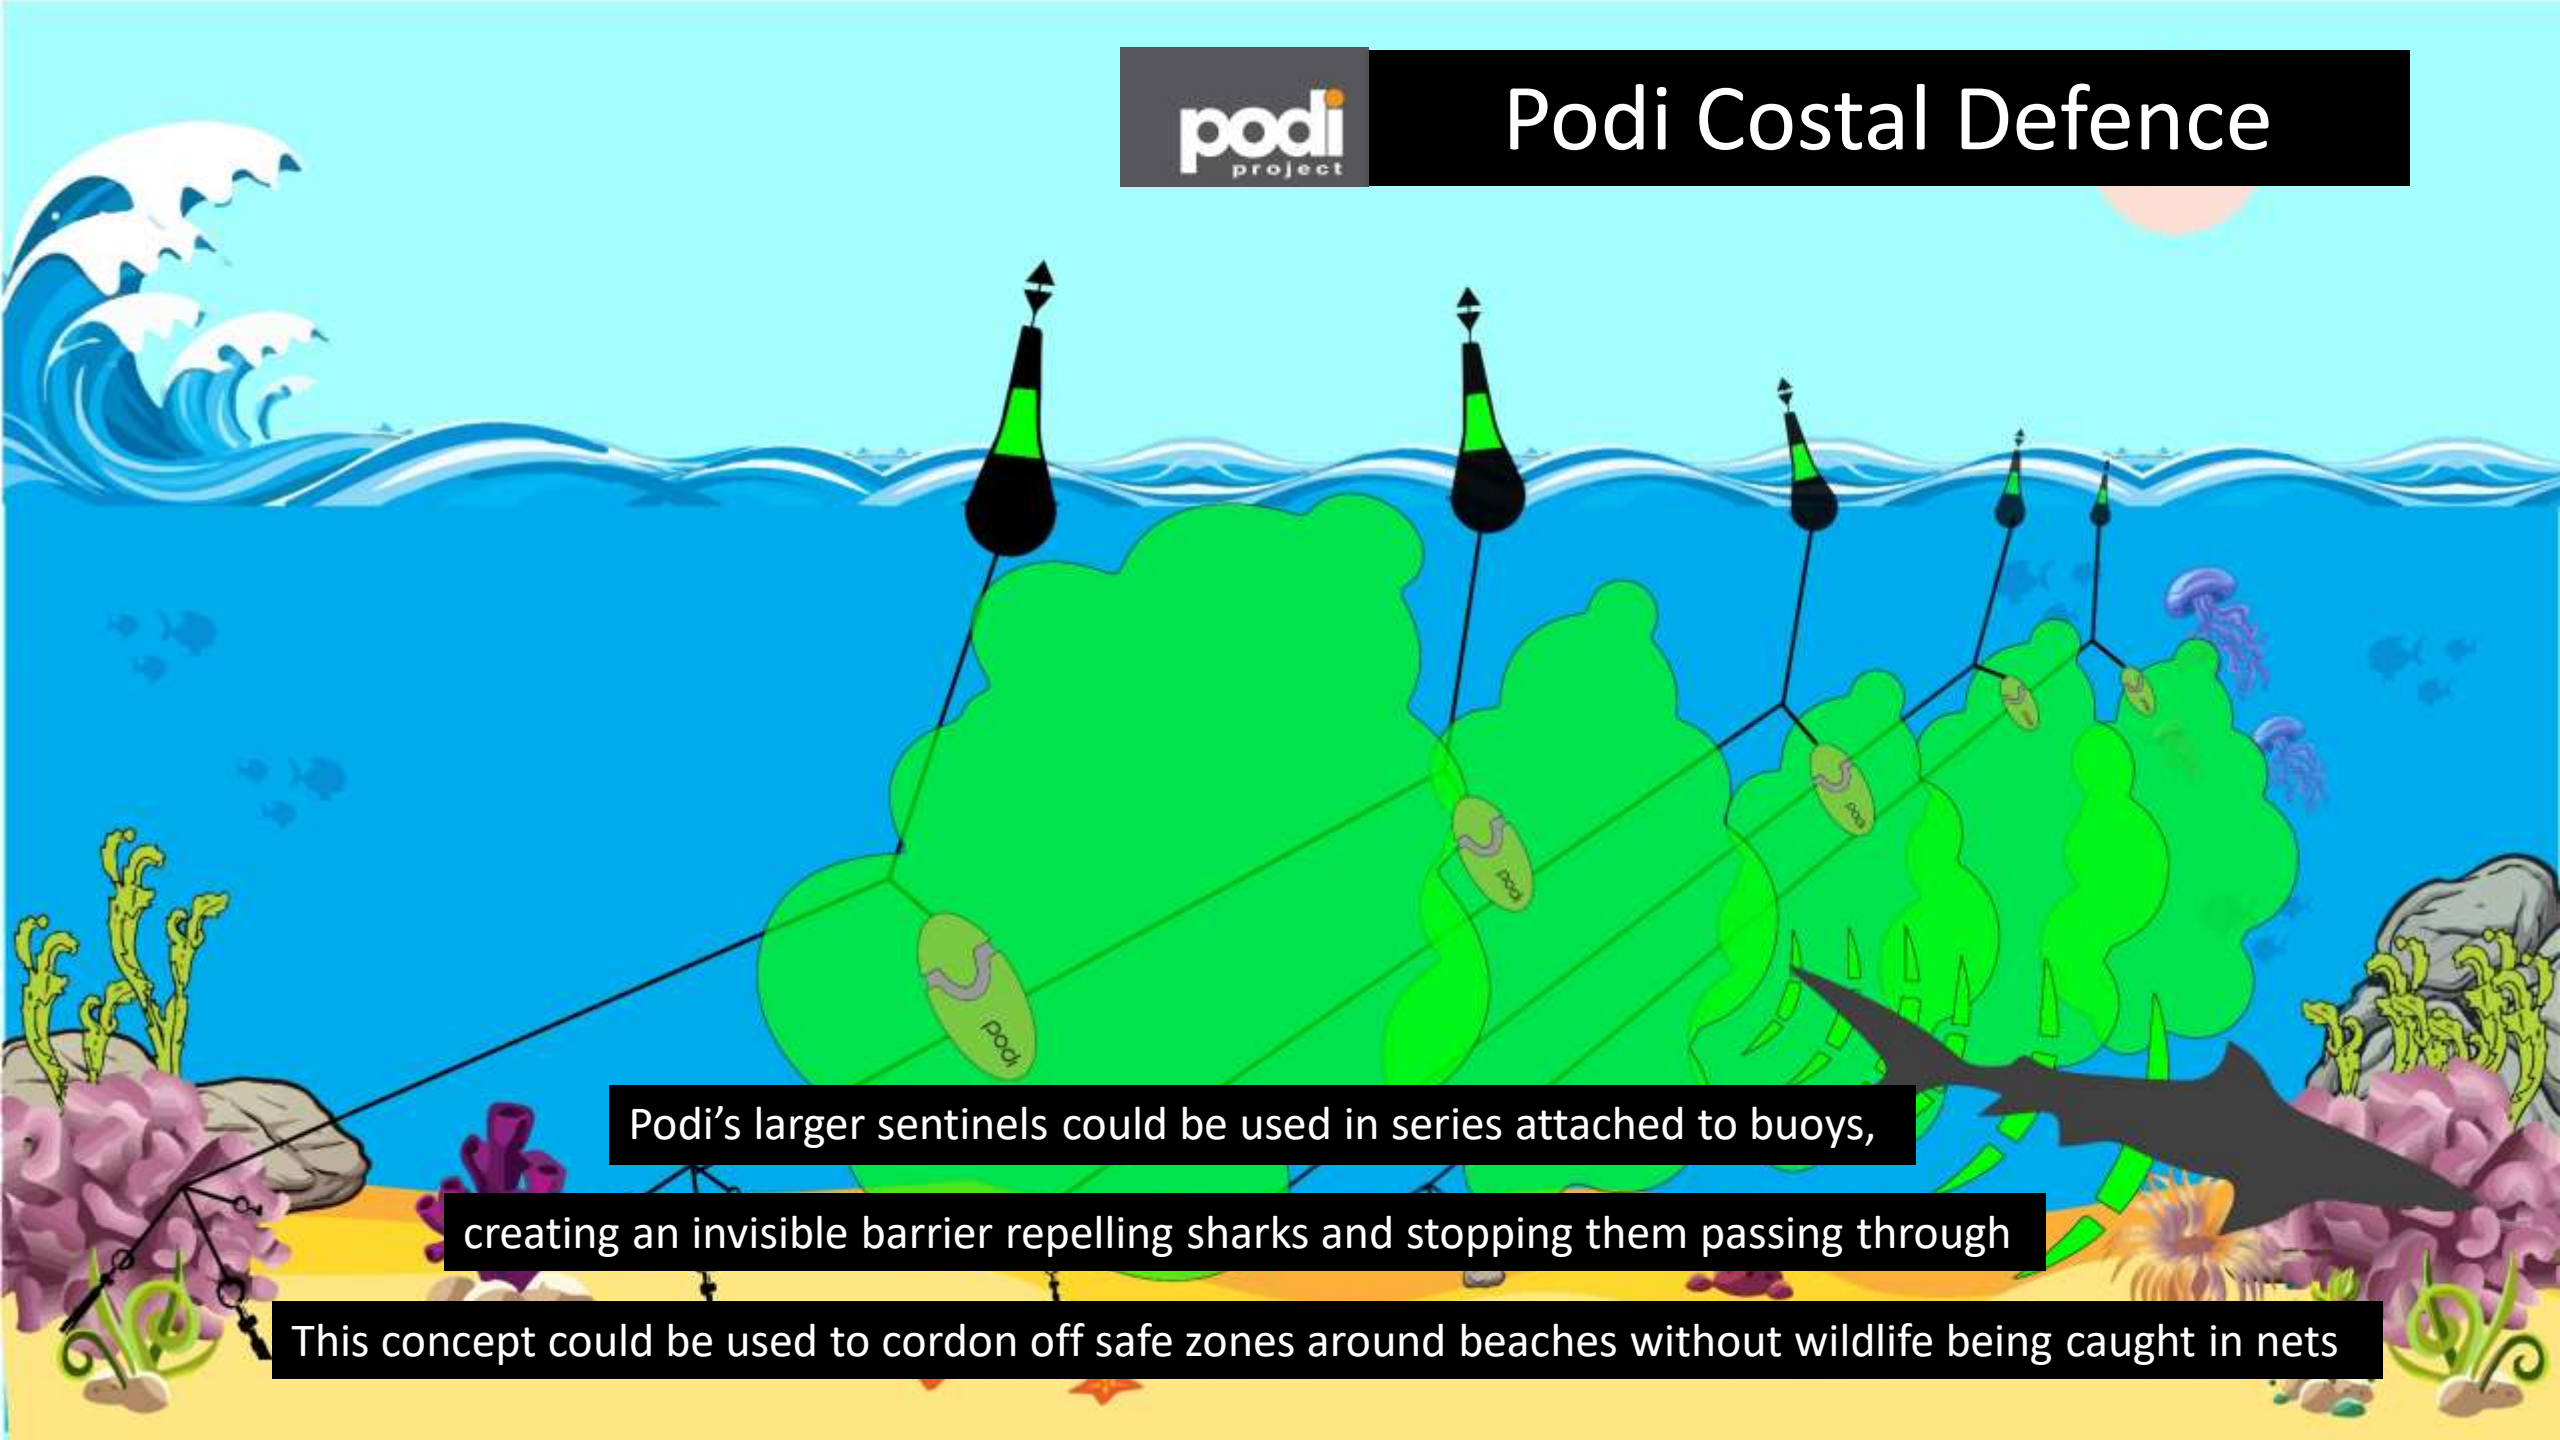

Podi's unique compound formulation would disperse sharks from the immediate area

Other wild life is unaffected, allowing the user to fish or scuba dive in safety

Podi's wrist and ankle strap would provide personal protection freeing the user up for safe swimming

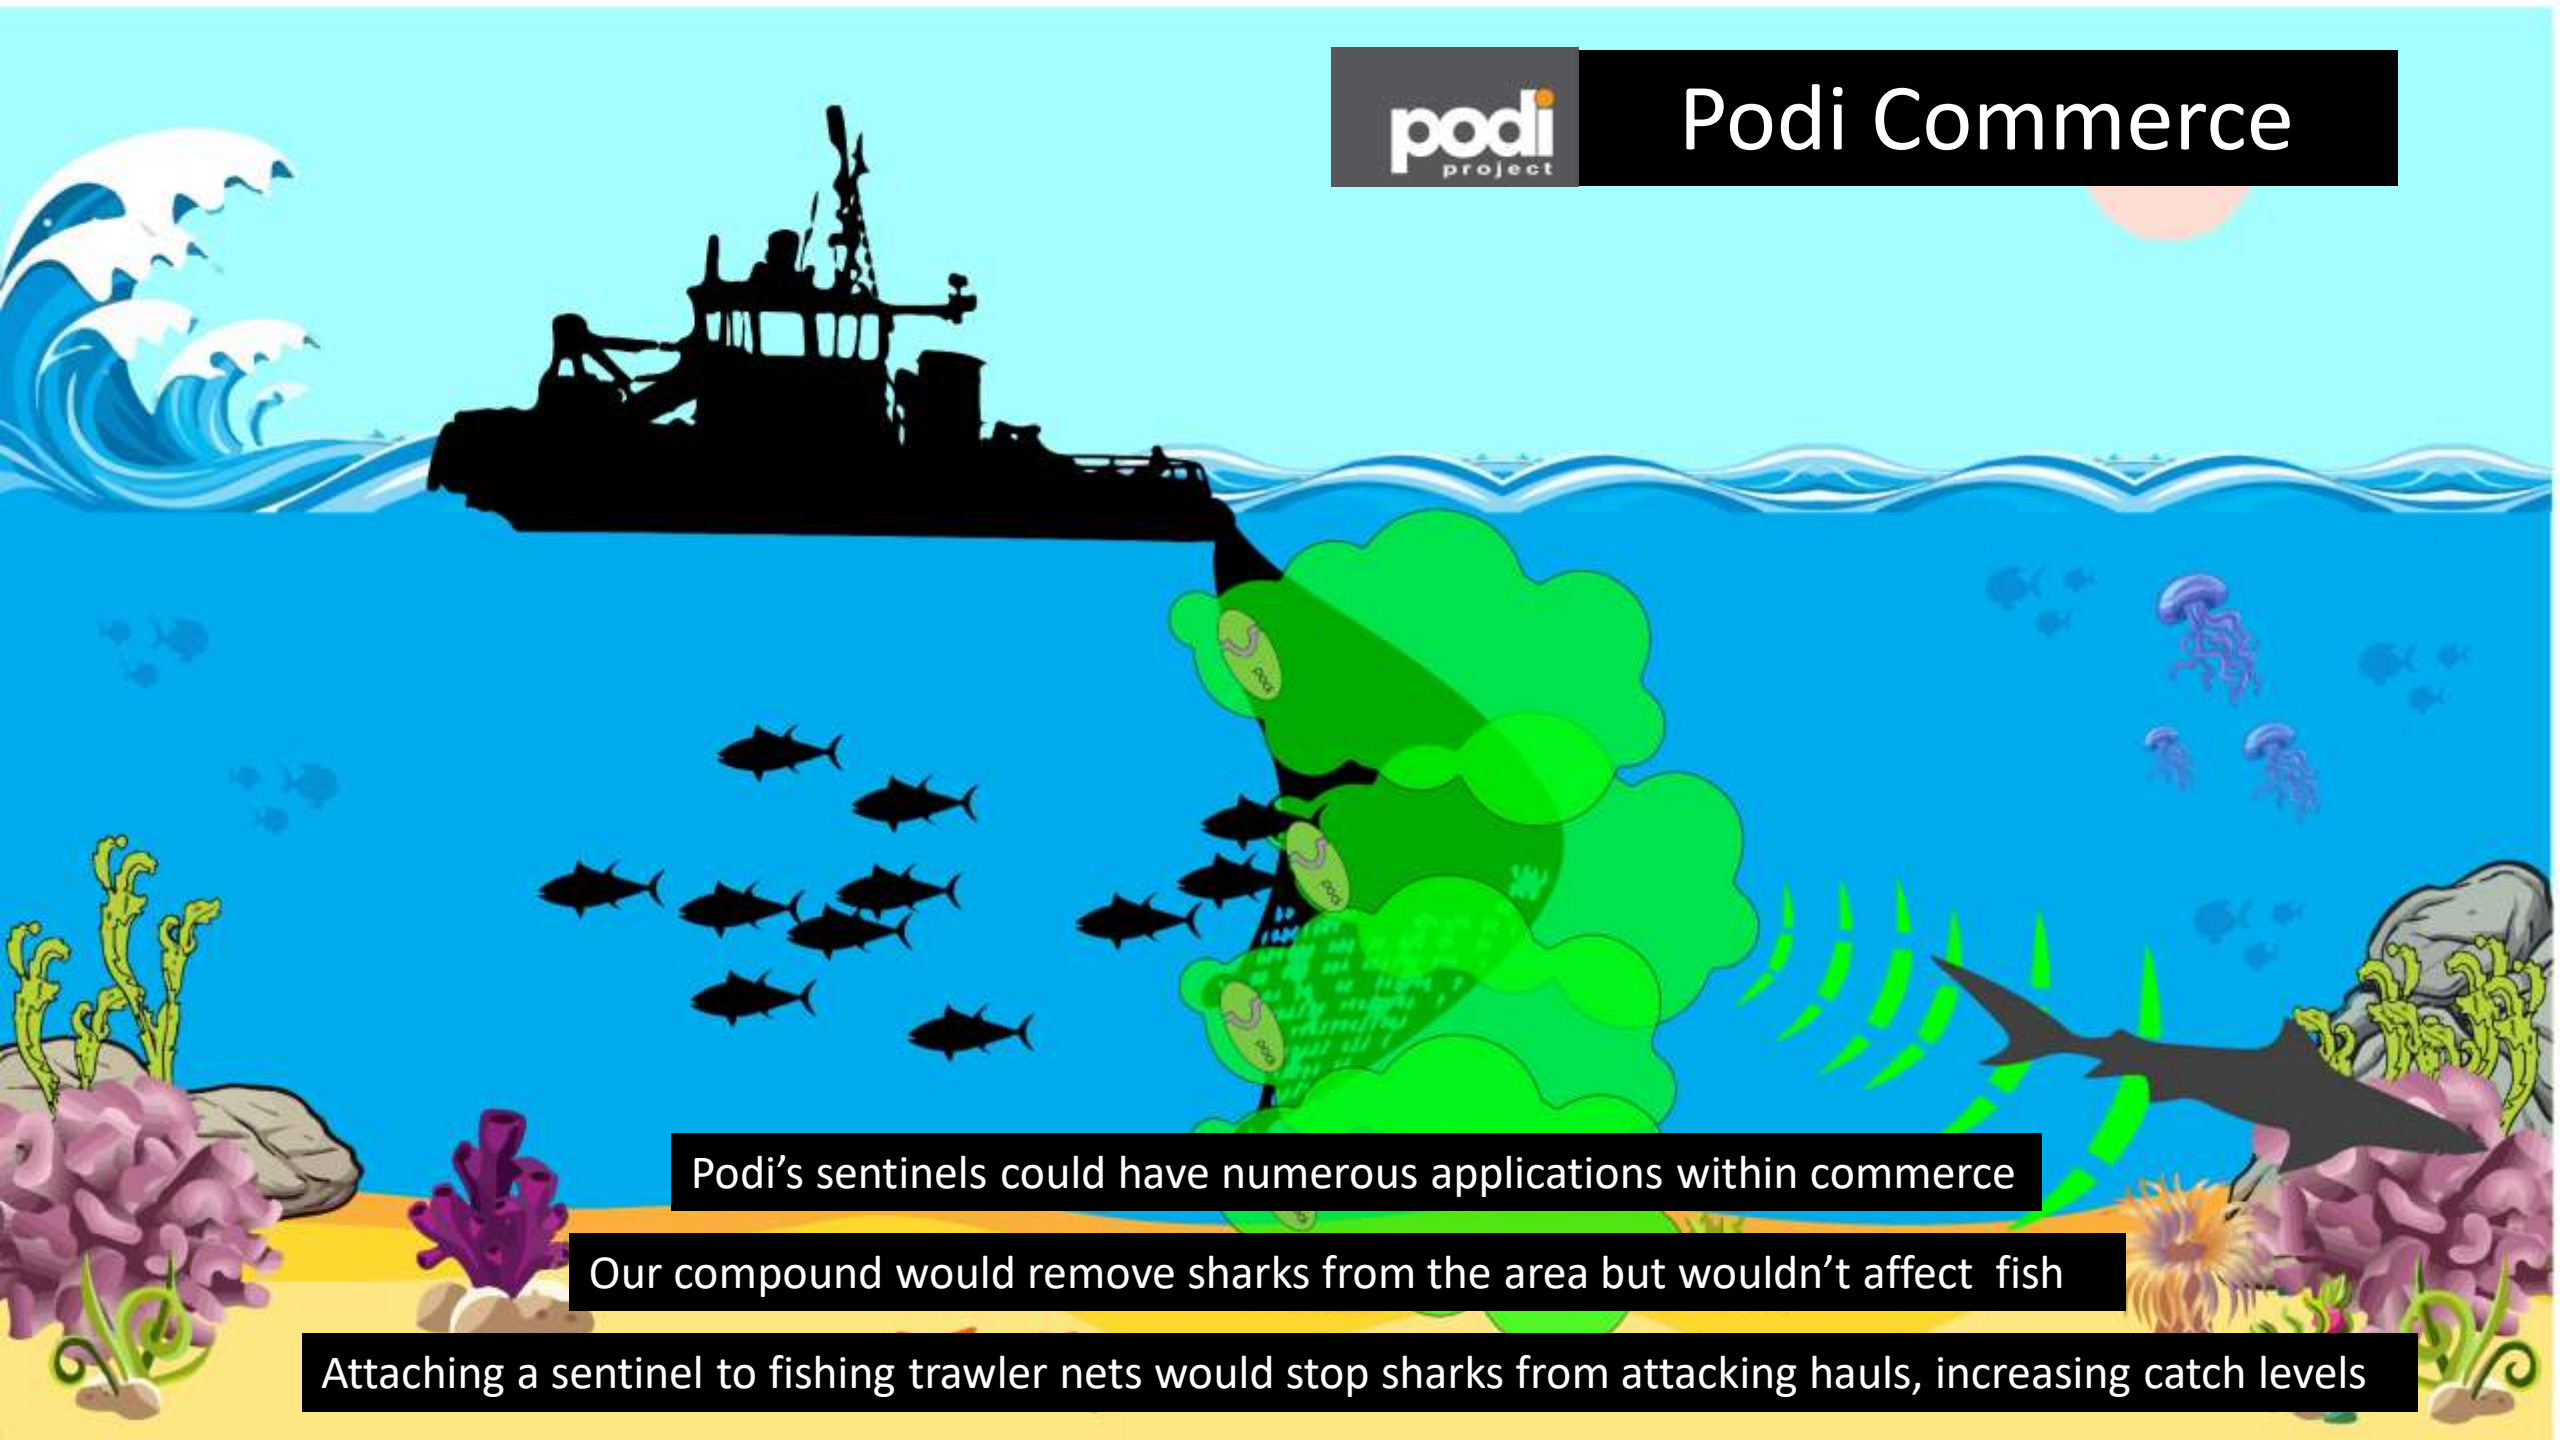

The more Podi's in the water, the larger the area of protection

Podi's larger sentinels could be used in series attached to buoys,

creating an invisible barrier repelling sharks and stopping them passing through

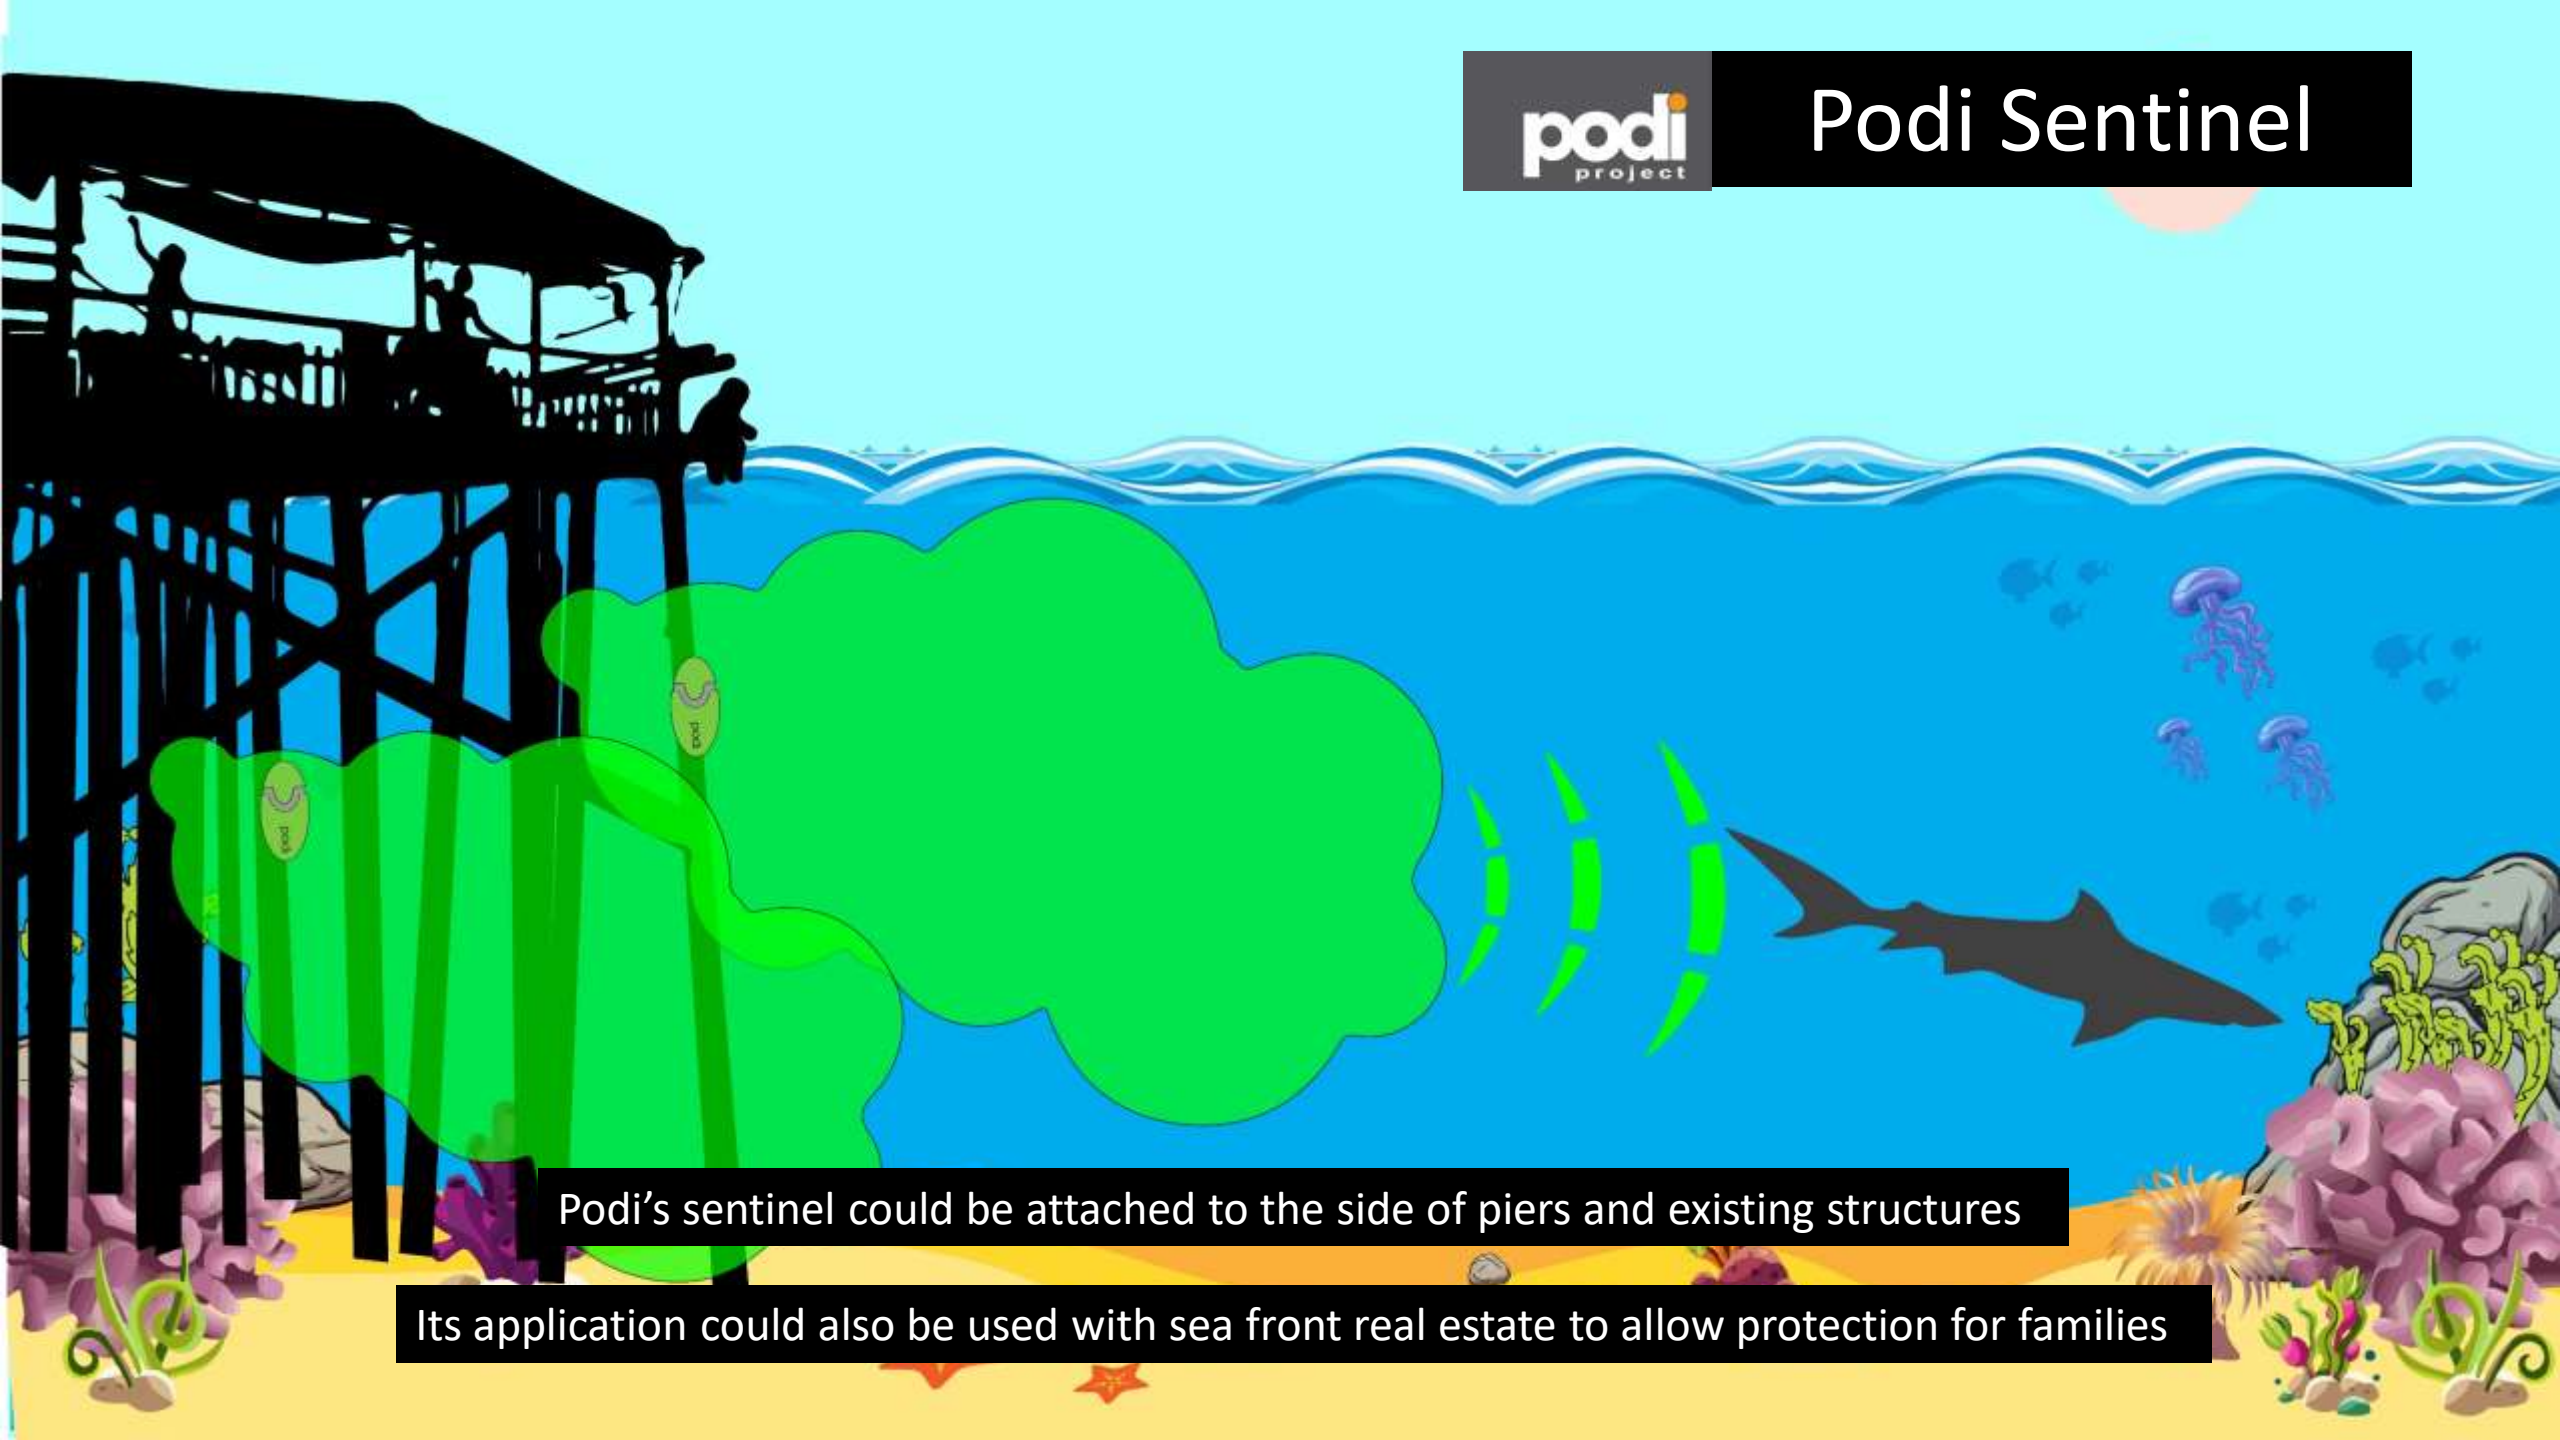

This concept could be used to cordon off safe zones around beaches without wildlife being caught in nets

Podi's sentinels could have numerous applications within commerce

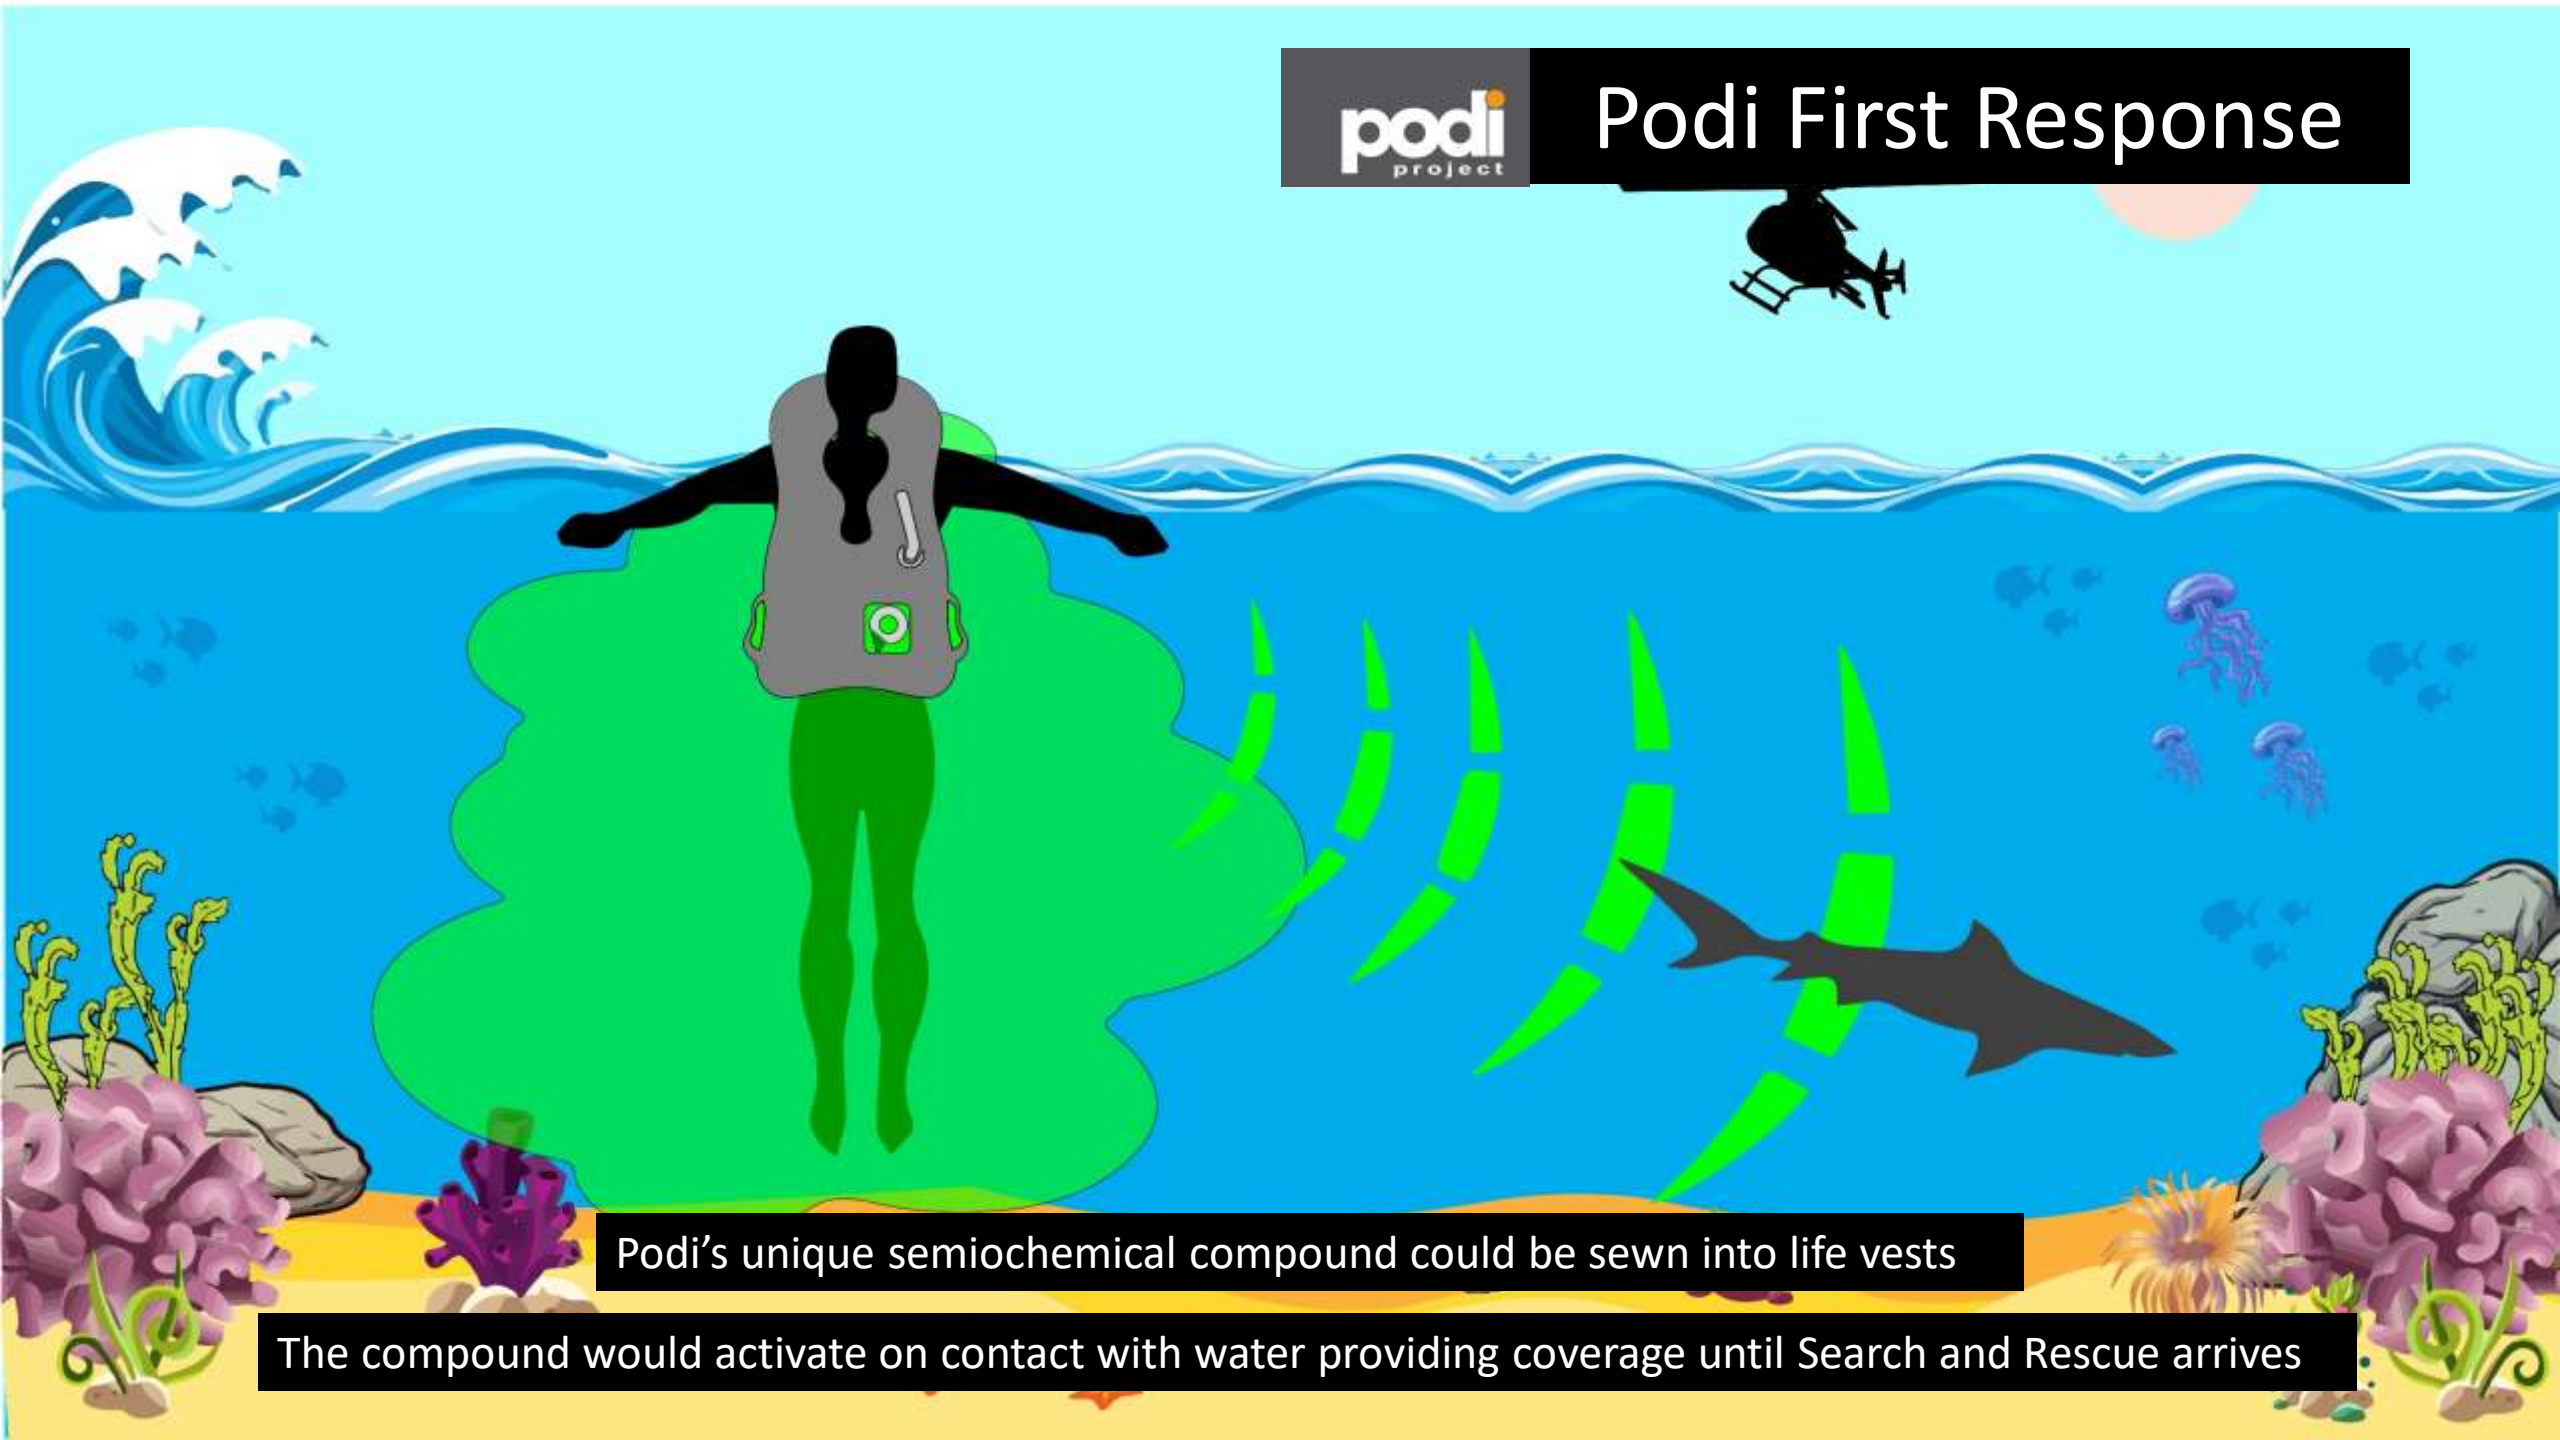

Our compound would remove sharks from the area but wouldn't affect fish

Attaching a sentinel to fishing trawler nets would stop sharks from attacking hauls, increasing catch levels

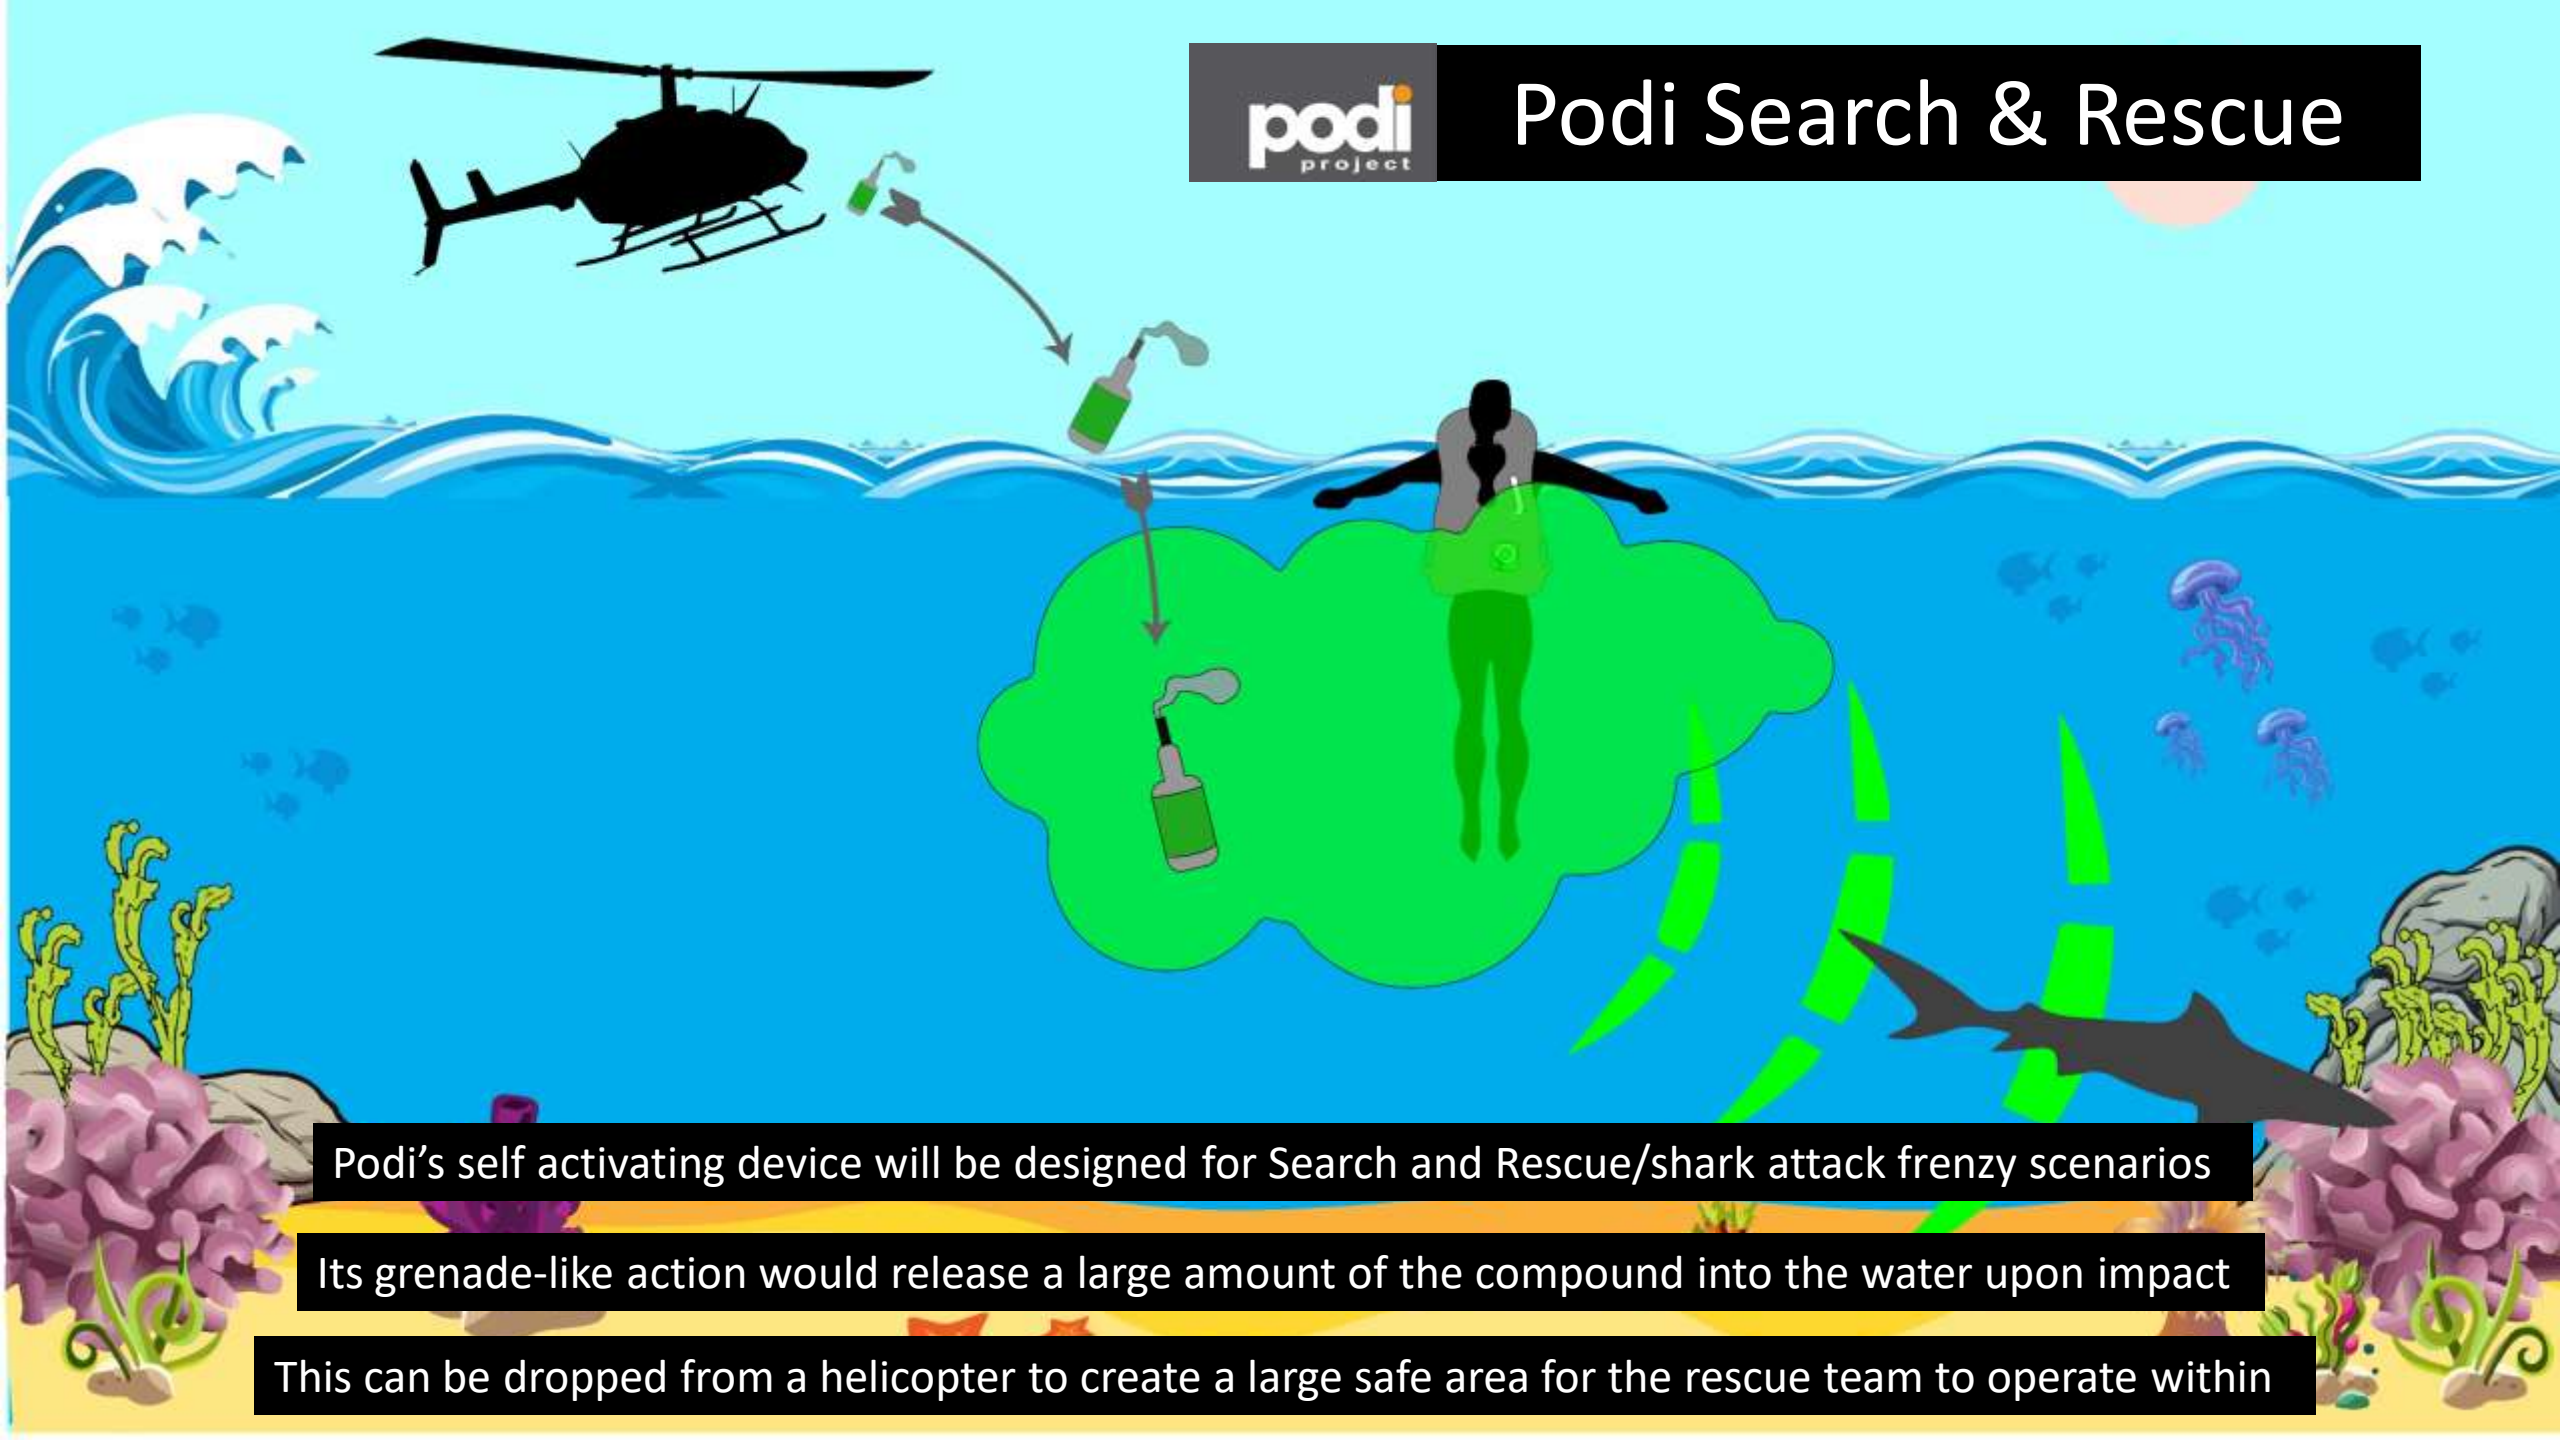

Podi's sentinel could be attached to the side of piers and existing structures

Its application could also be used with sea front real estate to allow protection for families

Podi's unique semiochemical compound could be sewn into life vests

The compound would activate on contact with water providing coverage until Search and Rescue arrives

Podi's self activating device will be designed for Search and Rescue/shark attack frenzy scenarios

Its grenade-like action would release a large amount of the compound into the water upon impact

This can be dropped from a helicopter to create a large safe area for the rescue team to operate within
